

# Team Andromedus - Project Epilogue

Lets talk about Laravel

```
1  /**
2   * Display the specified resource.
3   *
4   * @param int $id
5   * @return Response
6   */
7  public function show($id)
8  {
9      $post = Post::with('comments')->where('id', $id)->first();
10
11      return View::make('post.show')->with('post', $post);
12  }
```

Alexis Hoshino, Eric Tian, HQ Pham-Nguyen, Kathleen Enverga

# What is Laravel?

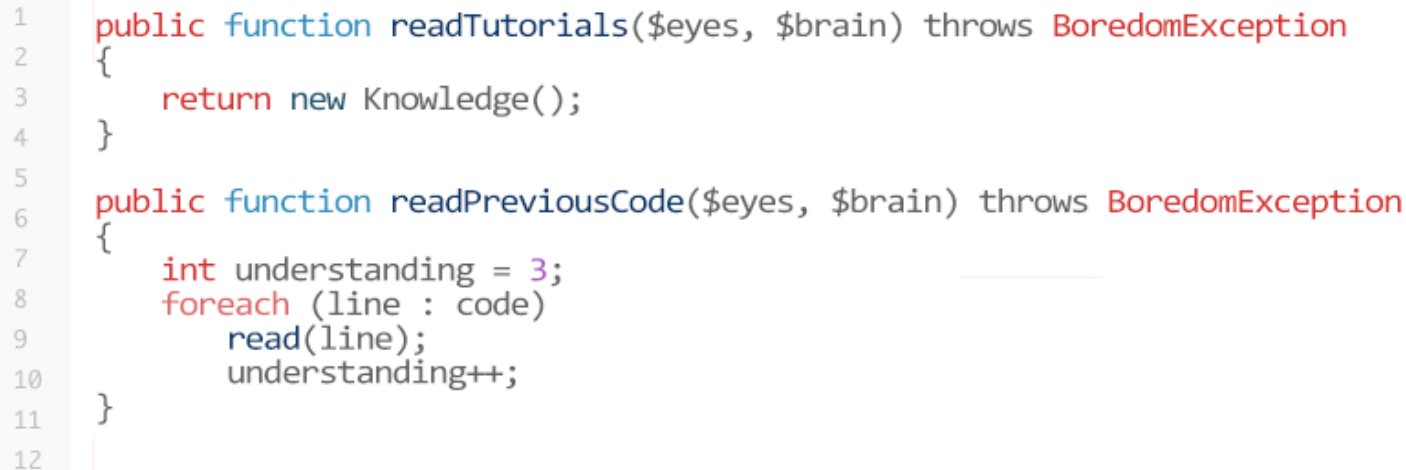

It's a PHP framework for web applications

```
1 public function explainSelf($laravel)
2 {
3     Laravel 4 is a framework for PHP designed to support the development;
4     of Model-View-Controller style web applications;
5
6     It provides a suite of tools and functionality within the framework that allows us
7     to coherently manage and build all aspects of a web application from;
8     the front-end design and templating, to the backend database;
9
10 }
11
12
```

It's pretty hip.

# How are we learning it?

## Reading tutorials and trying to add code

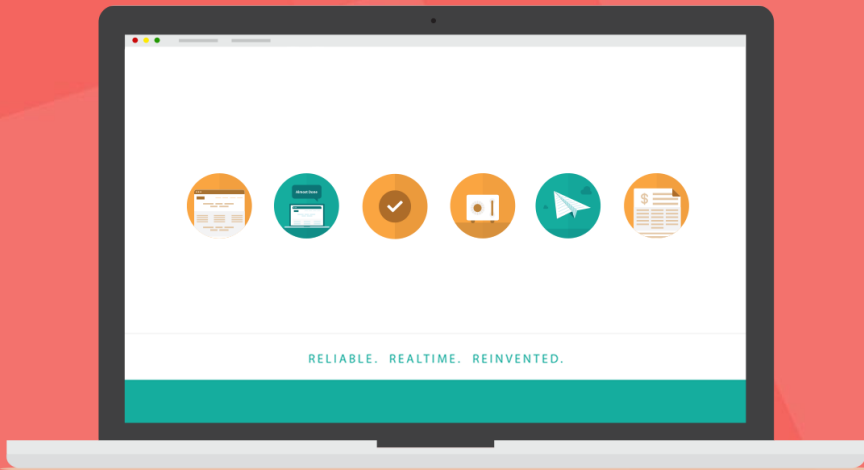

```
1 public function readTutorials($eyes, $brain) throws BoredomException
2 {
3     return new Knowledge();
4 }
5
6 public function readPreviousCode($eyes, $brain) throws BoredomException
7 {
8     int understanding = 3;
9     foreach (line : code)
10         read(line);
11         understanding++;
12 }
```

Errors for days though.

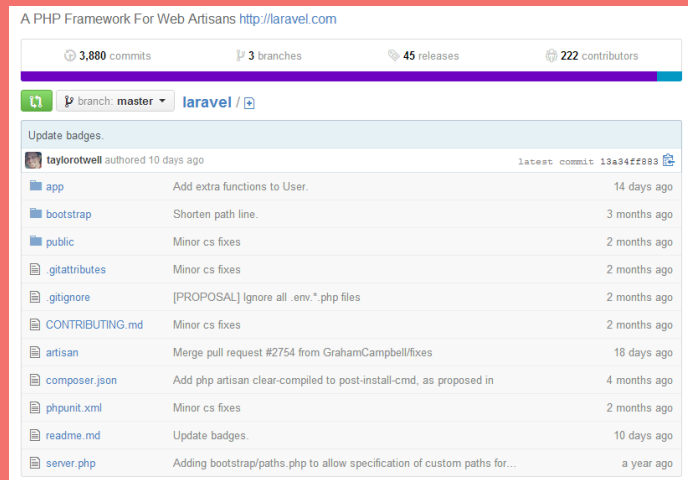

# What is it good for?

## Creating web apps

# How to use it?

## git clone it

## and work within the framework

It's rumored that Laravel is also good for your skin.

# What is it not good for?

Soothing babies

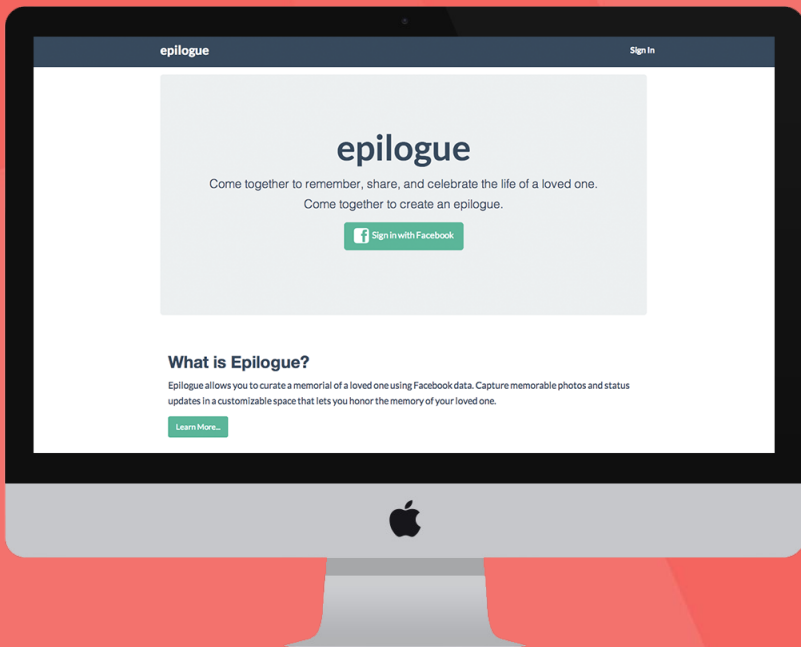

Laravel 4 can do a lot but it cannot comfort a crying baby.

**Pacifier: 1   Laravel: 0**

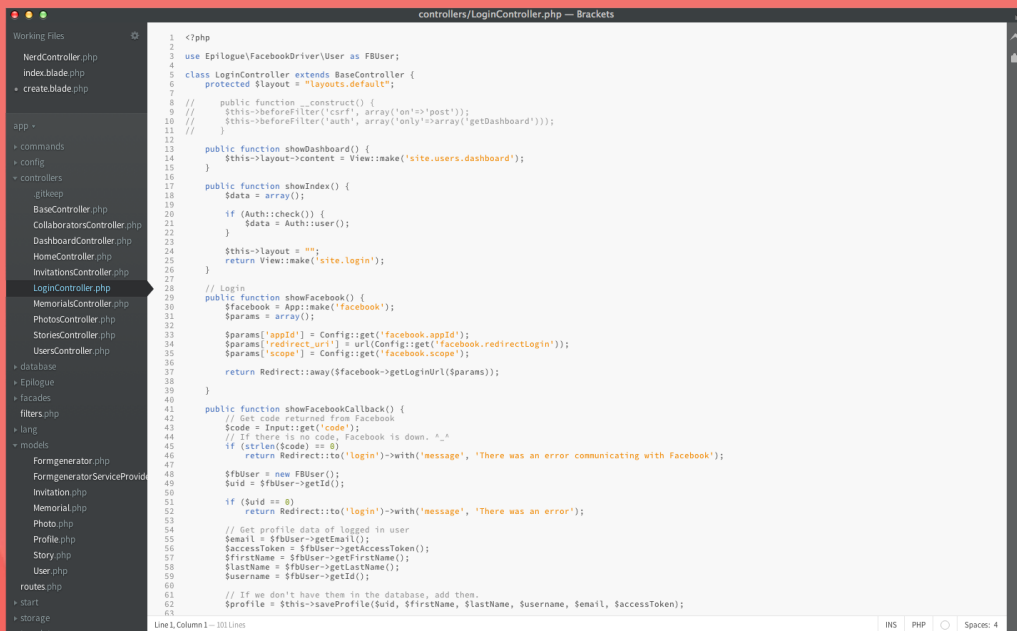

(sorry I didn't know how to answer this question)

# Examples

## Our app

## Our code

I promise I won't feel awkward if no one has any questions.
